

AVP SOLUTIONS – PRODUCTION SYSTEM, CURRENT STATE

Not an opinion – this is measured directly from AVP's own running data.

Compiled from 2 completed reports (an assessment of the old Excel system, 2026-09-14, and a live-data scan of the webapp, 2026-09-15) – every figure below is taken directly from real files/APIs, not a rough guess.

Sources: PACKING SLIPS.xlsm (1,853 rows) · DAILY LOG CHECK SHEET.xlsm (1,811 rows) · live RawMaterial (1,939 rows) · live Ledger (184 rows)

0 / 30

Days the hand-counted KPI report matched real data – measured across 30 sample days comparing SUMMARY IN&OUT against the original WORK ORDER. On some days the gap reached 105 lines. In other words, every management decision based on this report, across the 30 days measured, was made on a day that was never actually correct.

The 6 numbers that matter most

Every figure can be checked again directly against AVP's own data – none of it is an industry benchmark.

SHIPPED TO THE CUSTOMER

2 lines

Packing Slip 30102 was really signed and shipped to Infasco with **Quantity = 0** – caused by one missing calculation, only found on a later self-check; the customer was never told.

Source: LATEST_SESSION.md – section 2.6

TRAVELERS WITH MISMATCHED STATUS

797 / 1,847

43% of travelers have mismatched SHIPPED status/Packing Slip number between the 2 parallel Excel logs in use – two places to look, two different answers to the same question: "has this shipped yet?"

Source: BAO_CAO_TONG_HOP_AVP.md – section 1, row #1

HOURS OF LABOR LOST EVERY DAY

~32 hours

Estimated staff hours spent on manual typing + "searching for data" every day – **~8,000 hours/year**, administrative work only. (Revised 2026-09-15 from the initial 21–28 hour estimate measured 2026-09-14, based on real-world observation.)

Source: BAO_CAO_TONG_HOP_AVP.md section 4 + 2026-09-15 update

MISREAD YIELD LOSS

62%

Share of (Day+Machine+Station) groups with 2 or more different travelers sharing one machine on the same day – small batches get lumped together, making "yield loss" look far higher than it really is.

Source: BAO_CAO_TONG_HOP_AVP.md – section 2

A TRACKING CODE YOU CAN'T TRUST

41.1%

Pot# – still used for daily lookups – is actually **reused** across ≥ 2 different travelers over time, not a permanent fixed code as assumed.

Source: BAO_CAO_TONG_HOP_AVP.md – section 1, row #7

MANAGEMENT SCOPE

~1/8

Of the 8 core resources of a manufacturing business (materials, quality, machinery, labor, finance, customers...), AVP today truly manages exactly one – materials – and even that one is inconsistent across files.

Source: BAO_CAO_TONG_HOP_AVP.md – section 3

Where does that ~32 hours/day actually go?

Most of it is NOT time spent typing – it's time spent searching/cross-checking data across disconnected logs. (Revised 2026-09-15 from the initial 21–28 hour estimate, based on real-world observation.)

2 codes trusted every day – but not as trustworthy as assumed

Measured across all 1,853 real WORK ORDER rows, not a small sample.

Pot# – assumed to be a unique identifier

41.1% reused

469/1,141 Pot#s are attached to ≥ 2 different travelers over time (one Pot# tied to as many as 4 travelers on 3 different days) – only reliable within a single still-OPEN traveler, not reliable for historical lookups.

LOT NO. – assumed to always be a production lot code

59% is a status label

Most values are actually "TRAVELERRECEIVED" (not yet packed, 53.8%), "SORT&RETURN," or "SPLIT FROM TR#..." – a genuine lot code following the real convention makes up only 41%.

✓ **Evidence pointing the other way: the new system catches errors, and catches them fast**

In a single working session (2026-09-15), scanning live data directly turned up: 1 lot that had been read into the wrong column during scanning (Part#/Pot#/LOT# mixed up), and **22 travelers** that had missed being marked "shipped" from an earlier data entry – both were confirmed and fixed within that same session. Under the old way of working, errors like these only surfaced when someone happened to notice – nothing flagged itself.

PART 2 – WHY IT GOT THIS TANGLED

Infasco has its own form, AVP has its own form – and they don't line up

Not a typo problem – the two sides are genuinely using two different frames of reference for the same shipment.

LOT NO.

AVP USES IT AS An internal daily tracking key

×

INFASCO SEES NOT printed on the Packing Slip they receive

Verified against a real PS document (PACKING SLIP-1.pdf) – LOT NO. exists only inside AVP; the customer never sees the key AVP uses to trace it.

Part# (product code)

TOP OF THE TRAVELER One Part# written at the top

×

PACKAGING LABEL A DIFFERENT Part# printed on the final label

It has never been confirmed which one is the "official" code the customer actually needs – 2 places on the same shipment contradict each other.

Packing Slip number

NUMBER SOURCE Issued from OUTSIDE the AVP system

×

WHAT AVP DOES Re-types it by hand, can't auto-generate it

AVP's system has no control over where PS numbers come from – there is always one manual typing step that can never be fully automated.

Part# suffix (e.g. "-L", "-TH-TC")

RAWMATERIA "7151143403-L" (from the Infasco email)

×

FINISHGOOD "7151143403" (AVP's own entry at packing time)

Traveler 718064 – the same lot, and 2 places inside AVP's own system already disagree on the suffix, before even comparing against Infasco.

7 sources of confusion measured directly in the data – not a feeling

1

Time spent typing into forms

~7 hours/day of pure manual typing across WORK ORDER + Scanning Sheet + Packing List

2

Time spent searching for data

~25 hours/day searching across disconnected logs – more than 3 times the typing time

3

Duplicate data caused by system errors

In one session today: 22 travelers missed a status update, 7 rows with a matching Pot#=LOT# from an unidentified source, 1 PS really shipped with Quantity=0

4

Data scattered on the floor, never unified

Management has to keep a separate Excel file (Partial Boxes) outside the main system because the main system doesn't track it well enough

5

Data cut off mid-stream, no LOT number

53.8% of historical LOT NO. values are just "not packed yet" placeholders, not a real lot code

6

Quality – anything can ship

98.5% of rows are missing a QC status; only 1/194 rows have ever actually been blocked by the system for HOLD

7

Overlapping output, blind to yield loss

62% of machine groups run multiple travelers at once; 6.5% of travelers show output off by >50% for no clear reason

With a new system – which targets would prove it actually works

No empty promise of "better" – these are the exact same 6 numbers above, re-measured once the system is in place, compared directly before/after.

Hours/day spent "searching for data"	
TODAY	~25 hrs
TARGET	< 2 hrs
% of rows with a recorded QC status (PASS/HOLD)	
-----	100%

TODAY	1.5%
TARGET	> 95%
% of travelers with mismatched "shipped" status across logs	
TODAY	43%
TARGET	0%
Days the KPI report matches real data (out of 30)	
TODAY	0/30
TARGET	30/30
% of "surplus" rows with a Traveler# for traceability	
TODAY	45.4%
TARGET	100%
Packing Slips shipped wrong to the customer / quarter	
TODAY	≥ 1 real case
TARGET	0 (blocked before shipping)

The question isn't "should we switch to an ERP"

The real question is: the numbers above already exist, and are already affecting decisions every day – they simply had never been measured. What's needed isn't "a full digital transformation," it's one small, risk-free step.

Proposal: run the new system in parallel for 2–4 weeks on exactly the one pain point that's easiest to see – an automatic KPI

dashboard — Excel stays exactly as it is, no one loses anything if it's wrong, and there's only more information gained if it's right.
